How do I create buffers for my KINEROS watershed?
Posted by isburns - 2007/11/03 22:54

_____

To create riparian buffers, watersheds must first be created for the KINEROS model. In addition, these watersheds must have been parameterized with the geometric flow length method. To determine which method your watershed uses, view the metadata for that watershed. If the flow length method parameter is "Mean", you cannot use the watershed to create buffers. The flow length method must be set to "Geometric". To set the default flow length method, go to AGWA Tools>Preferences and select the desired flow length method.
